

Fundamentals for Node JS

Node JS Tutorial in Hindi #5 Fundamentals for Node JS

Create a file

Create a file named `basics.js`.

Open terminal.

How to Use Variables and Functions

```
var a = 10; // function scope variable
let b = 20; // block scope variable
const c = 30;
```

```
a = 100;
```

```
b = 200;  
// c = 300; // this will give an error because const value cannot be  
changed  
  
console.log(a + b + c);
```

To run and check output in terminal:

```
node basics.js
```

You can redeclare and reassign var and let values.

You **cannot** change a const value — this will give an error.

How to Use Conditions and Loops

```
if (a == 200) {  
  console.log("this is if condition");  
} else {  
  console.log("this is else condition");  
}
```

Function Example

```
function fruit(item) {  
  console.log("fruit is " + item);  
}  
  
fruit("apple");  
fruit("banana");
```

For Loop

```
for (var a = 0; a <= 10; a++) {  
  console.log(a);  
}
```

While Loop

```
var a = 0;  
while (a <= 10) {  
  console.log(a);  
  a++;  
}
```

How to Use Arrays and Objects

Array Example

```
var user = ["anil", "sam", "peter", "bruce"];  
  
for (var a = 0; a < user.length; a++) {  
  console.log(user[a]);  
}
```

Object Example

```
var user = {  
  name: "anil",  
  city: "delhi",  
  age: 29,
```

```
};
```

```
console.log(user.name);  
console.log(user.city);  
console.log(user.age);
```

How to Import Functions or Variables From Another File

Export from data.js:

```
module.exports = {  
  userName: "Anil Sidhu",  
};
```

Import in basics.js:

```
const data = require("../data.js");  
  
console.log(data.userName);
```
