

Difference Between Module and Function (Node.js)

1. What is a Module?

A module is a separate file containing code—such as variables, functions, or classes—that can be imported and reused in other files. Modules help organize code, avoid repetition, and keep a project structured. Node.js has many core modules like fs, http, path, os, etc.

Think of a module as a toolbox. A toolbox holds many tools.

Example (Module in Node.js):

```
const fs = require('fs');
```

Here, "fs" is a module that contains many functions.

2. What is a Function?

A function is a block of code designed to perform one specific task. You call the function whenever you need that action. Functions improve reusability and reduce code repetition.

Think of a function as a single tool inside the toolbox.

Example (Function in Node.js):

```
fs.readFile('data.txt', 'utf-8', (err, data) => {  
  console.log(data);  
});
```

Here, readFile() is a function inside the fs module.

3. Easy Visual Representation:

Module (fs)

- readFile() (Function)
- writeFile() (Function)
- appendFile() (Function)
- unlink() (Function)

4. Simple Comparison Table:

Module:

- A file containing multiple functions or utilities.
- Helps in organizing and structuring code.
- Examples: fs, http, path, os.

Function:

- Performs a single task.
- Called when you want to run its logic.
- Examples: fs.readFile(), console.log(), Math.max()

5. Very Simple Summary:

Module = A collection of functions in a file.

Function = A single reusable action.
